

### Project Reflection:

We learned a thing or two along the way and next time we will consider the followings:

1. The idea for this project was ambitious, completing it during this semester was hard and we had to cut a lot of corners so we can finish in time. We had to use and implement a lot of new languages that we didn't know before (PHP, HTML, CSS, XML, JAVA SCRIPT...). We wasted time on the internet trying to learn and understand what we are facing, as a result our code is a bit messy, and would work better if we knew the languages better.
2. As the course helped us to complete the project it also interfered with our progress. We had to keep up with the project documentation and backlog instead of working on the code itself. We had to learn by our self the new languages without the support of the staff, also to complete side assignments given to us every week.
3. The fact that we are working students and not a real dev team meant that we didn't have a lot of time to work on the project. We needed to find gapes in our schedule to complete every milestone.
4. Working with the client representative helped us to adjust and complete the product according to the client's vision. This time we were kind of a client, but in future project it will be mandatory.
5. We want to continue with the product development, even up to distribution level.
